Application Toolkits

The power of Softsite32 Enterprise can be integrated directly into custom applications. With these components, a complete surveillance system can be designed as a stand alone application, Web based portal or a simple utility to link POS data receipts to video as well as card access integration.

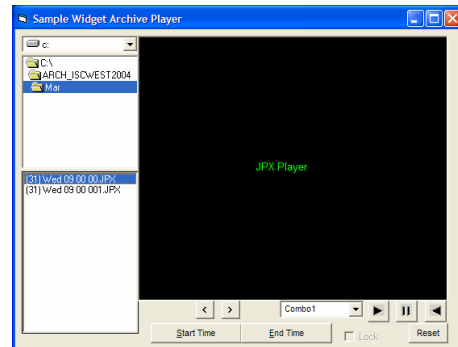

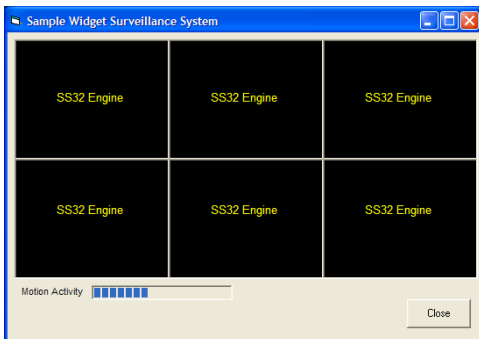

JDS offers three components to make this task very easy. Each component is ActiveX based and can be implemented within minutes of use. These components are;

SS32 Engine	Streaming video engine. Live View, Recording, Motion Detection, Events, PTZ
JPX Player	Video Playback with instant search and retrieval.
Stream Cast Engine	Intelligent multicasting technology. Control multiple views of common camera feeds.

Each component can be used in popular languages such as Visual Basic, C++ and many others. The controls can be used on web pages as well. JDS offers these toolkits for developers who want to integrate advanced functionality into their legacy applications, or create a new surveillance system from the ground up.

Our toolkits come with sample applications to demonstrate the use of the functions. Each toolkit is available as a separate purchase, or together as a package. Demo kits are available upon request.

The applications below were built in less than thirty minutes of development time each. The application on the left can display 6 video feeds at 30 FPS each, record, and perform video motion detection with event firing on motion. This allows other processes to be performed by the developer upon the motion event. The application on the right allows navigation to a video segment, loading of it, and playback with basic playback button functions.

A functional demo version supporting *live* cameras with complete documentation is available for download at www.softsite32.com
