

# ENTERPRISE COMMAND CENTER

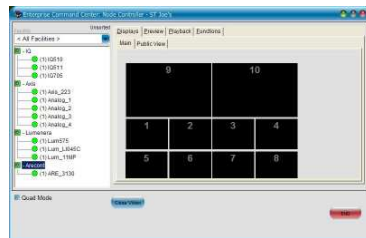

## Distributed Network Video Virtual Matrix

Command Center (C2) is a software based matrix video switching application. IP based, any compatible digital streaming video feed can be routed to any PC that has been configured to run the light weight client. Multi-Monitor configurations allow for specific screens to display one or multiple camera feeds at any Resolution. Video walls of any size, shape and resolution can be built using industry standard PC hardware components.

System control is easily achieved from a 'remote' called the Node Controller. The Node controller shows an iconic overview of the monitors in the array. The user merely 'touches' a camera name and then selects the monitor it is to be displayed upon.

- *Touch Screen, Keyboard or Mouse control.*
- *Punch up video, archives, messages or multimedia content to any node on the VPN, LAN, or WAN.*
- *Content can be broadcast system wide or specifically to targeted personnel or public view monitoring systems.*
- *Card access and other external events can easily drive the system.*
- *A simple text based API is used to allow customization tailored to a user's specific needs.*
- *Configurable 'profiles' allow groups of cameras to be displayed on targeted monitor groups.*
- *'Guard tour' functions allow monitors to roll video feeds selectively.*
- *Can be used stand alone or with Enterprise series recording systems.*
